

EOTS – What is Optronic testing?

Two- and three-axis motion simulators can also be used to test optro-electronic systems such as gyro-stabilized cameras, sights and targeting systems.

- Two-axis Test System
- Precise Position on both axis
- Precise Motion on both axis

- Three-axis Test System
- Precise Position on all three axis
- Precise Motion on all three axis

Typical electro-optical (optronic) Units Under Test
